TRANSCRIPT

Hello! My name is Ariana, and today I'm gonna be showing you a few safety items that you can use to help prevent the spread of the coronavirus. The items we will be going over are surgical masks, infrared thermometers, and non-latex or latex gloves.

The first item that I'm going to be showing you how to use is this mask. There are many different types of masks that you can use. Some of them include surgical masks, and others can include cloth mask or pattern masks, like the one I have here. Masks are very useful for many purposes; they can catch germs and prevent the spread from person to person. And, they can reduce the risk of infection from 100% to 90% down to .5%. How we were going to put on your mask is that you were going to notice the two loops on the side. These are going to go around your ears, securing the mask across your face. Like this. An important thing to know notice is that the mask is below my chin and above my nose, due to the fact that germs can go out through my nose, and by keeping it below my chin it prevents any molecules of the coronavirus from going upwards and into my breathing areas.

The next item that I'm going to demonstrate is the infrared thermometer. This is what it looks like! As you can see there are many components to this. There is a trigger-like button, there are multiple settings, there's a scan that has the infrared teams, and on the other side, there is a thermometer area that shows the temperature of what you're trying to measure. How are you in Measure someone somebody with the infrared thermometer is that you take the temperature gun, you hold it to their forehead, and you press down. [BEEP] Once it beeps it has taken your temperature and you can read it. As you can see, my temperature is 98.4 and I, therefore, do not have a fever and will be safe to interact with.

The final piece of safety equipment that I will demonstrate using gloves. I personally am allergic to latex so I am a fan of latex-free gloves these gloves are often colored in pink blue or green. So these gloves will use I put them on the wrist and pull

down your fingers just like any other glove! [theme music] you might be wondering if I breathe in the coronavirus, how do gloves really help? Say, for example, you touch a door handle that someone with the coronavirus has touched. They're infected germs will be on the door handle when you go to touch it. If you're wearing gloves, and see you touch your face or like I just did adjust your hair or touch your eyes, or sneeze and go like this in your hands are all over wearing gloves. Often times if you're out in public, you also will also be wearing a mask, which will also help prevent you from catching touching areas of your face that are susceptible to catching the coronavirus. Another important thing when it comes to wearing gloves off. How do you want to take off your gloves, it's like this: touch the base, you grab it, and you just pull it over. You do the same with your other hand joining the gloves as one unit they can easily dispose of. This is a very helpful tool due to the fact that touching the gloves with your bare hands defeats the purpose of wearing the gloves in the first place; and you're still contracting germs.

Thank you for watching this tool's introduction video. Most importantly, stay safe, and I hope you enjoy the rest of the website.
